GENERAL SURGERY

In our general surgery department, we not only perform surgery but also utilize traditional methods.

We offer surgery for obesity, gallbladder, goiter, abdominal wall hernias, rectal prolapse, anal fissures, anal fistulas, hemorrhoids, gastric cancer, breast cancer, colon cancer, and pancreatic cancer.

We primarily focus on surgeries of four systems.

The first is the endocrine system, which includes breast and thyroid cancers, as well as adrenal tumors. Especially for adrenal tumors, surgeries are performed using minimally invasive methods.

The second is the gastrointestinal tract, which includes laparoscopic surgery for colon and rectal cancer, as well as gastric cancer. The third area we focus on is surgery for liver, pancreatic, and biliary system cancers, defined as hepatopancreaticobiliary cancers. The fourth area is procedures for obesity-related diseases.

In addition to traditional methods, minimally invasive techniques are used for gallbladder cancer and certain liver tumors. Our general surgery department offers more than just surgery; we also provide services in many different areas, such as surgical intensive care, parenteral/enteral nutrition, and the treatment of surgical infections.

For more details about the event, please contact us.

NEUROSURGER

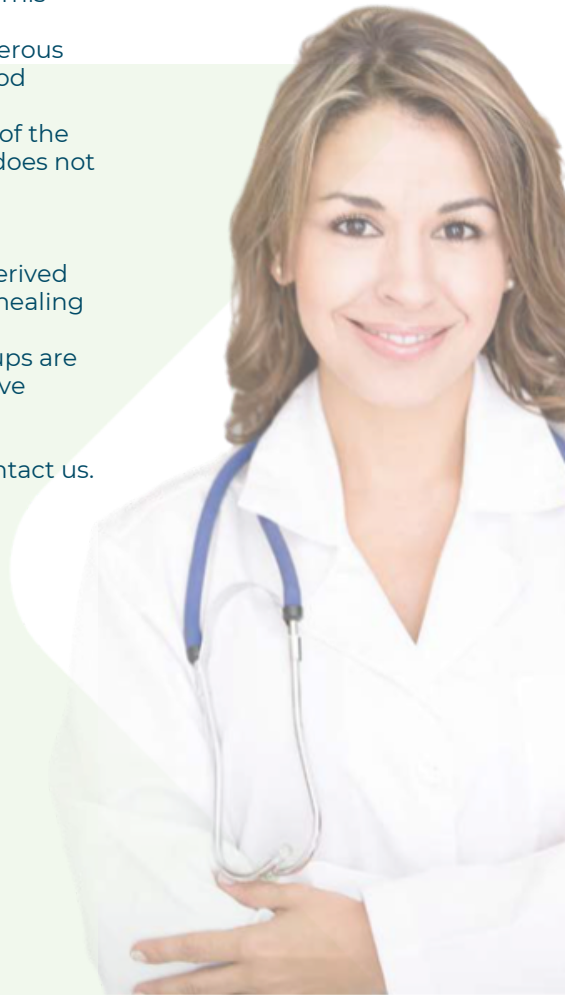

Cerebral hemorrhage, glioma, herniated disc, and aneurysms.

Neurosurgery, in other words, is the treatment of diseases of the brain and nerves, tumors originating from or exerting pressure on brain tissue and the spinal cord, as well as the treatment of dorsal and cervical herniated discs, injuries to the head and spinal cord, cerebrovascular occlusions and cerebral hemorrhages, and the vessels supplying the brain spinal cord.

It is a branch of science that deals with the diagnosis and treatment of diseases such as aneurysms, that is, the formation of bulges. This department intervenes with surgical methods in diseases affecting numerous vital functions, such as narrowing of the blood vessels in the neck and diseases that develop during the formation of the nervous system in newborns, epilepsy that does not respond to medication, and certain cases of Parkinson's disease.

The dictionary definition of neurosurgery, derived from the words neuron and surgery, is "the healing of wounds of the nervous system." Diseases observed in adult and pediatric patient groups are diagnosed and treated at the Brain and Nerve Diseases Clinic.

For more details about the event, please contact us.

ORGAN TRANSPLANTATION

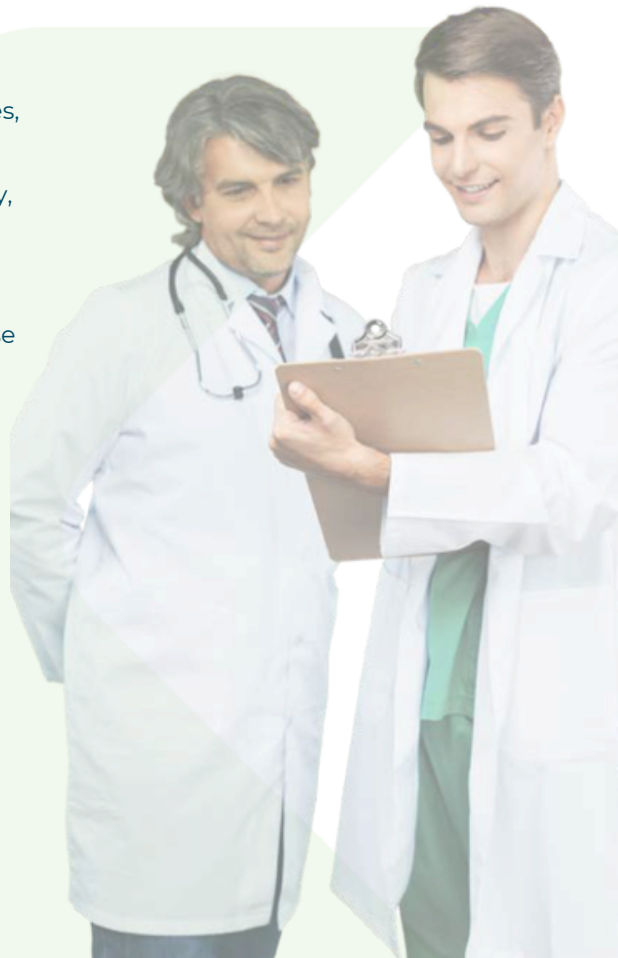

We successfully perform these delicate operations which require professionalism.

Organ transplantation is the operation in which an organ is taken from the donor's body and then placed in a recipient's body to replace a damaged or missing organ. The donor and recipient may be in the same location, or organs from a donor in a separate location may be transplanted into a recipient located elsewhere.

Organs or tissues to be transplanted may be taken from living bodies or from deceased individuals. Transplantation medicine is one of the most challenging and complex fields in modern medicine. Organs that can be successfully transplanted today include the heart, kidneys, liver, lungs, pancreas, intestines, thymus, and uterus.

When medical data is analyzed globally, it is found that the most common transplanted organs are the kidneys, followed by the liver and heart.

For more details about the event, please contact us.

ORTHOPEDICS & TRAUMATOLOGY

Occupational orthopedics and trauma treatments.

Spinal Surgery

Surgery for scoliosis and kyphosis, spinal stenosis, spondylolisthesis, treatment of adult spinal deformities, treatment of lumbar and cervical discopathy.

- ✓ Regular dental checkups
- ✓ Fillings and endodontic treatment
- ✓ Dental implants
- ✓ Orthodontics
- ✓ Maxillofacial and oral surgery
- ✓ Dental crowns

For more details about the event, please contact us.

HAIR TRANSPLANT

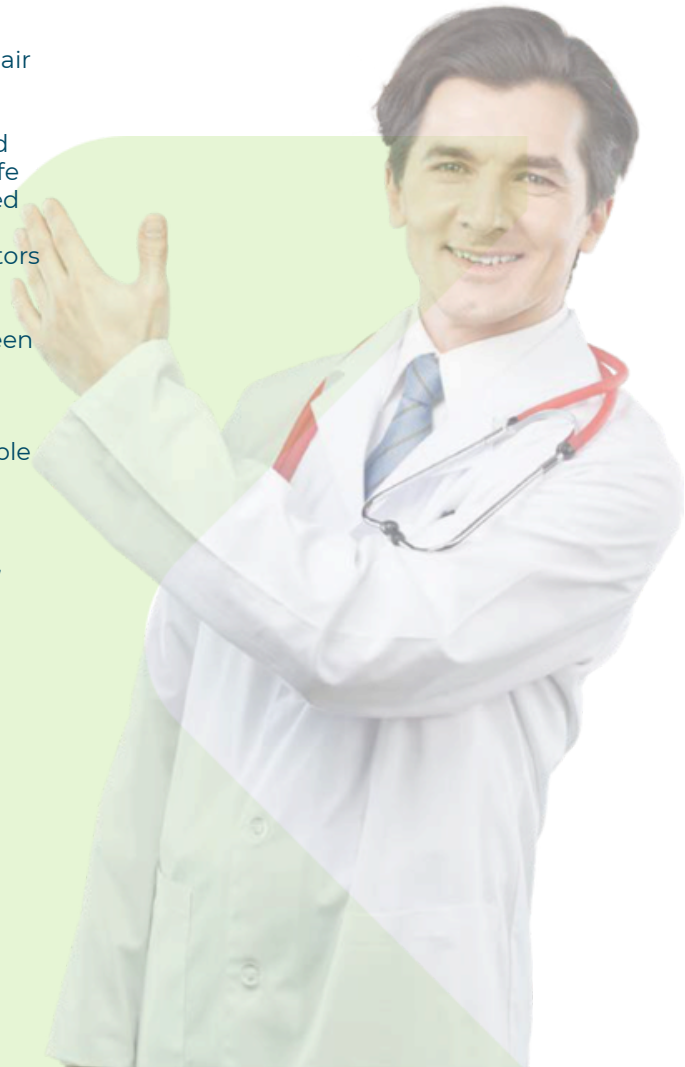

Hair transplantation is a natural and long-lasting solution for treating thinning hair and baldness. It involves transferring the patient's healthy hair follicles to areas where hair density has decreased.

This procedure is planned on a personalized basis. Resistant follicles are harvested from the donor area (usually the back of the neck) and then implanted into the thinning areas using modern microsurgical techniques. The goal is to achieve a permanent and natural-looking result, without leaving any visible traces as the hair grows back.

Hair transplantation is considered minor surgery. To guarantee a safe and effective result, it is performed in a medical environment by specialized and experienced doctors and teams. Thanks to this procedure, hair grows back permanently, as if it had never been lost.

Our goal is to restore the natural appearance of hair in a comfortable setting, using state-of-the-art medical technologies.

For more details about the event, please contact us.

VIP SERVICES

Comfortable treatments with the USMD difference.
